

Types of Requirements:- 1) User Req 2) System Req

System Stakeholders:- Any person or organization who is affected by system.

Stakeholders type:- 1) End users 2) System managers/owners 3) External stakeholders

Functional and Non-functional Requirements

↓
What a system should do

↓
how well it should do it.

Product Requirements

Organizational Req

External Requirement

Req which specify that The delivered product must behave in a particular way eg. execution, speed, reliability.

Consequence of org
policies and procedures
e.g: process standards
used, implementation
requirements etc

Requirements which arise from factors which are external to the system and its development process, e.g.:

Examples of Non-functional Requirement:-

- i) Product Requirement:- The MHC PMS shall be available to all clinics during normal working hours. Downtime within normal working hours shall not exceed five seconds in any one day.
- ii) Organizational Requirement:- Users of MHC PMS shall authenticate themselves using their health authority identity card.
- iii) External Requirement:- The system shall implement patient privacy provisions as set out in HSIAM 03.2006 priv.

Step 1:- Value total = Relative Benefit $\times$ weight + Relative Detriment $\times$ weight
 value total = Benefit $\times$ Relative Benefit weight + Detriment $\times$ Relative Det weight.

Step 2:- Sum value total.

Steps:- find value:-

$$\text{Value \%} = \frac{\text{Value total (Req)}}{\text{Sum of value total}} \times 100$$

Step 4:- find cost:-

$$\text{Cost \%} = \frac{\text{Cost of Req}}{\text{Total Cost}} \times 100$$

Step 5:- find Risk:-

$$\text{Risk \%} = \frac{\text{Relative Risk of Requirement}}{\text{Total Relative Risk}} \times 100$$

(Numerical)

$$\text{Value} = (6 \times 2) + (3 \times 0.5) = 12 + 1.5 = 13.5 ; \text{Sum of value total} = 75.5$$

$$\text{Value \%} = 13.5 / 75.5 = 17.88\%$$

$$\text{Cost \%} = 2 / 18 = 11.11\%$$

$$\text{Risk \%} = 1 / 13 = 7.6\%$$

Step 6:-

find priority Score

$$\text{Priority} = \frac{(\text{Value \%})}{(\text{Cost \%} \times \text{Relative Cost weight}) + (\text{Risk \%} \times \text{Relative Risk weight})}$$

$$\text{Priority} = \text{Benefit} \times \text{Relative Benefit weight} + \text{Detriment} \times \text{Relative Detriment weight}$$

$$\text{Cost \%} \times \text{Relative cost weight} + \text{Risk \%} \times \text{Relative Risk weight}$$

$$\text{Value} = (6 \times 2) + (3 \times 0.5) = 13.5$$

$$0.11 \times 1 + 0.07 \times 1 = 0.18 = 75$$
